Rebellion Defense builds software products that turn data into mission impact.

The New Defense Digital Base

The defense industrial base has a proud legacy of building critical hardware for military forces. In an era in which information reigns supreme, however, advanced software is the difference between obsolescence and mission success. Rebellion was founded on the conviction that national security is a shared responsibility, so we're showing up to do what we know best: building software products that deliver mission results when they matter most.

Rebellion is building the new **defense digital base**. Our products are leading the way for the future of all-domain operations to bring unparalleled insights and faster decision making from headquarters to the tactical edge. Whether countering emerging global threats from technologically savvy challengers such as China, or securing our most critical weapons platforms, Rebellion is leading the transition of all-domain operations into a digital world that relies on flawless software technology to remain ahead of our global adversaries.

To achieve this audacious mission, we've created a company that comprises world-class technologists who have built many of the world's largest software platforms. Our team also includes military veterans and national security professionals who are intimately familiar with the complexities surrounding government technology. Rebellion embodies a new way of thinking about how software products are built and deployed to support those responsible for the mission of national security.

Turning data into actionable insights

The volume of national security data can be overwhelming when legacy tools, often ill-equipped to deliver timely and relevant insights, are the first-line solutions. At Rebellion, we're focused on engineering powerful, automated, software solutions that apply artificial intelligence to deliver information from complex, vast, and siloed data streams. Rebellion products are built to transform three critical national security challenges:

Analyze

Analyze products **enhance data analysis**, to include automated processing of imagery, text, full-motion video, and other multimedia sources.

Secure

Secure products **protect data security and weapons platforms**, to include network monitoring and continuous vulnerability assessments.

Transport

Transport products **streamline data transfer**, to include cross-domain solutions for information sharing across systems, networks, allies, and classification levels.

Products that simply work

Innovation begins when tradition has failed. At Rebellion, we're taking an unconventional approach to defense technology by self-funding product development—our customers only pay for the value they receive.

Exceptional products are meaningless without a commitment to relentless delivery. At Rebellion, we work with our customers to deliver value in days, not years. Our software engineering principles are based on continuous feature development, user-centered design, responsible applications of artificial intelligence, and operational reliability with dedicated teams to support evolving mission needs. Rebellion customers get well-defined, measurable outcomes from our products, enabling them to achieve mission success. Our software-as-a-service (SaaS) model ensures customers gain immediate and measurable value on day one and maintain continued value through iterative addition of new features.

Rebellion draws on the wide experience of Silicon Valley investors who trust in our delivery and in the mission of strengthening national defense through modern technology. They include Eric Schmidt, Innovation Endeavors; Ted Schlein, Kleiner Perkins; Nick Beim, Venrock; and James Murdoch, Lupa Systems. Their combined expertise in launching world-renowned technology companies, along with the strategic counsel of our esteemed national security advisors, further fortifies Rebellion as an enduring partner in the emerging defense digital base.
